item – NEW: Quick and versatile – the new KLICK Fastening Sets

This is a new dimension in terms of versatility: Profiles can now be joined without any machining, at any point and at nearly any angle. Profile sections can now be added to existing constructions and used as variable struts that can be used and reused as required.

No planning or machining

Wherever an easily adjustable framework using the MB Building Kit System is needed, the KLICK Fastening Set is the first choice: test constructions, scaffolding jigs for lights and camera and adjustable fixtures for production industries.

KLICK and done!

The great advantage of the KLICK Fastening Set is in the speed of application. Attaching the fastener to the profile groove and fitting the catch using a quarter-turn are a simple matter. The fastener is tightened and fixed by means of a laterally-placed tensioning screw. In this way, maximum versatility is combined with simple operation!

Have you KLICKed yet?

Solingen-based item Industrietechnik GmbH develops and supplies the MB Building Kit System, which enables individual solutions to be created for all sectors of industrial equipment construction. The Building Kit System is based on aluminium profiles, a perfectly matched connection method and versatile functional components.
